Summary:

- We expect the growth of renewable energy to be a multi-year tailwind for utilities companies.
- The EIA estimates that nearly 75% of US power generation will be from the combination of cleaner-burning natural gas and renewable power sources by 2050.
- Utilities are deploying capital on natural gas and renewables projects to position for the future.
- This growth trajectory—away from coal towards renewables and natural gas power generation—is reinforced by public opinion and regulatory support.

We expect the growth of renewable energy to be a multi-year tailwind for utilities companies.

In its Annual Energy Outlook 2020, the US Energy Information Administration (EIA) said it expected electricity generation from renewables to surpass coal in the coming years, and it estimated that nearly 75% of US power generation will be from the combination of cleaner-burning natural gas and renewable power sources by 2050.¹ In fact, the EIA reported that we already saw renewables surpass coal in May 2020.²

The coal to natural gas and renewables switch is still in the early innings, and we see a significant growth opportunity for utilities in renewables, in particular.

Notably, the growth trajectory is reinforced by public opinion and regulatory support:

- 26 states have green house gas emissions targets—and 65% of the US population resides in these states
- 29 states have adopted the Renewable Portfolio Standard
- 11 states have a 100% clean energy goal or mandate—these are long-term targets, typically ranging from 2040-2050

While commitment levels and timetables vary, we think, in aggregate, these initiatives will provide a tailwind for the utilities space. Clearly, this transition will require significant capital deployment from utilities companies. Utilities do have to balance capital deployment plans against the impact on consumer bills, but utilities have also stated that they have huge backlogs of potential projects. As a reminder, in the utility model, rate-base growth puts upward pressure on consumer costs, but we believe these prospects for growth put certain utilities in an enviable position today.

We believe the Miller/Howard Utilities Plus portfolio is poised to capture this opportunity. According to Sustainalytics, 85% of the companies in the portfolio have less than 25% involvement in coal power generation, so we do not have significant concerns about stranded assets as coal plants are retired. Meanwhile, we see the companies in our portfolio focusing their capital deployment on natural gas and renewables projects to position for the future.
